USE CASE

A small team fixing the right cloud gaps first

Aribot scans your cloud read-only and maps every gap to HIPAA and GDPR, so a lean security team works on what matters most.

THE PROBLEM

A hospital group runs clinical systems across several clouds with a handful of security staff.

Breaches in healthcare cost more and take longer to contain than anywhere else, and the team cannot review everything.

WHY IT MATTERS NOW

$7.42M

average cost of a healthcare breach, the costliest sector for 14 years running, with 279 days to contain

Source: IBM Cost of a Data Breach Report 2025

HOW ARIBOT HANDLES IT

1 **Connect read-only**

Link AWS, Azure and GCP accounts with read-only access.

2 **Scan the posture**

Check resources against security standards and rank findings by severity.

3 **Map to HIPAA and GDPR**

Each gap shows the requirement it affects.

4 **Fix with approval**

Run a dry run first, approve, and re-check the resource after the change.

WHAT YOU GET

- A ranked list of cloud gaps with the regulation each one touches
- Read-only access that clinical IT can accept
- Fixes that are verified, not assumed
- Evidence for HIPAA, GDPR and NIS2 reviews

SEE IT IN THE DEMO

- Cloud Accounts: read-only connections
- Scan Results: findings by severity per resource
- Verified Outcomes: a fix closes only when the resource agrees

See it for yourself
