
USE CASE

Ask about your estate in plain English

Ayurak Intelligence answers questions about your own estate with its sources cited, and any change it proposes waits for a person to approve it.

THE PROBLEM

I inherited an alert queue, and getting context on one finding means opening several screens.

An assistant that can change infrastructure worries me unless there is a hard stop between a suggestion and an action. If an automated change fails halfway, I need it on the record.

WHY IT MATTERS NOW

95%

of security teams report a skills gap; 59% call it critical or significant

Source: ISC2 Workforce Study 2025

HOW ARIBOT HANDLES IT

1 **Ask a question**

Type a question in plain English, such as which threats sit on your latest diagram.

2 **Get a cited answer**

The answer names the diagram and account it was read from, so you can check it.

3 **Review a proposed fix**

Suggested changes appear as proposed actions at pending approval, with nothing changed.

4 **Approve or roll back**

Approved actions run, and a change that fails mid-apply is rolled back and kept on the list.

WHAT YOU GET

- Answers drawn from your own diagrams and accounts
- The source cited with every answer
- Proposed changes held at pending approval
- Failed changes rolled back and recorded

SEE IT IN THE DEMO

- A chat panel with a question and an answer that cites its source
- A proposed actions list with statuses PENDING APPROVAL, EXECUTED and ROLLED BACK
- Counters for questions answered, actions proposed, executed and rolled back
- Suggested queries, such as asking for your compliance posture
