

USE CASE

An execution log that includes work that never started

Every remediation, scan and policy run with its outcome, including jobs that were scheduled and never began, exported as one trail.

THE PROBLEM

Our history shows what ran, which quietly leaves out the job that was scheduled and never started. A scan that didn't happen gets noticed weeks later, usually by the problem it would have caught. An export of successful runs is a highlight reel, and the auditor knows it.

HOW ARIBOT HANDLES IT

- 1 Record each run**
Approved remediations, scans and policy changes are logged with their outcome.
- 2 Keep failures in view**
Failed and in-flight work is recorded alongside successes.
- 3 Sweep the schedule**
A sweep covers the full schedule and flags work that never started.
- 4 Export the trail**
Pick a date range and export every state, never-started included.

WHAT YOU SEE IN THE DEMO

- Counters for succeeded, failed, in flight and never started
- A compliance re-scan row marked NOT STARTED
- An execution timeline filterable by success, failed and running
- Sample totals labelled as illustrative figures, not customer data

WHO IT IS FOR

Director of Security Operations

Internal Audit IT Manager

SRE / Platform Lead

WHAT YOU GET

- Never-started work listed and counted on its own
- Failures recorded beside successes
- A timeline you can filter by status
- An exportable audit trail that covers every state
