

USE CASE

Report untested controls as untested

Aribot keeps unmeasured as its own visible state, so every score carries its coverage and an untested control never counts as a pass.

THE PROBLEM

Our posture report shows a control nobody tested the same way as a control that passed. Percentages arrive without a denominator, so a high score over a small sample reads as estate-wide. We find the gap at audit, which is the worst place to find it.

HOW ARIBOT HANDLES IT

- 1 **Ask for a posture score**
Choose a scope and a framework, and the score arrives with its basis.
- 2 **See what was not measured**
Untested items are listed separately and left out of the denominator.
- 3 **Read the reason**
Where a check could not run, the reason is kept, for example that no account is connected.
- 4 **Close the gap**
Connect the missing source or run the test, and coverage rises on the next read.
- 5 **Report both figures**
The report pack states the score and how much of the estate it covers.

WHAT YOU SEE IN THE DEMO

- A page marked Research Preview that covers the problem and the outcome
- A flow from asking for a posture score to a pack that states both score and coverage
- A gap explained by its cause, such as no account connected
- An Answers that admit what is unknown card describing the observable result

WHO IT IS FOR

- CISO
- Head of GRC
- Compliance Manager
- Internal Audit IT Manager

WHAT YOU GET

- Coverage shown beside every score
- A list of controls never evaluated, each with the reason it could not run
- Board and audit packs that say what was not measured
- A clear next action for each gap

52%

of compliance professionals spend 30–50% of their time on administrative tasks; nearly half struggle with evidence gathering
